

# Winning Space Race with Data Science

Lampros Tsirogiannis 03.07.2022

### **Outline**

- Executive Summary
- Introduction
- Methodology
- Results
- Conclusion
- Appendix

### **Executive Summary**

#### Summary of methodologies

- Data collection
- Data wrangling
- EDA with Data Visualization
- EDA with SQL
- Interactive Dashboard with Folium and Plotly Dash
- Predictive Analysis (Classification)

#### Summary of all results

- Exploratory Data Analysis results
- Interactive analytics demo
- Predictive analysis results

### Introduction

#### Project background and context

The commercial space age is here, companies are making space travel affordable for everyone. Virgin Galactic is providing suborbital spaceflights. Rocket Lab is a small satellite provider. Blue Origin manufactures sub-orbital and orbital reusable rockets. Perhaps the most successful is SpaceX. SpaceX's accomplishments include: Sending spacecraft to the International Space Station. Starlink, a satellite internet constellation providing satellite Internet access. Sending manned missions to Space. One reason SpaceX can do this is the rocket launches are relatively inexpensive. SpaceX advertises Falcon 9 rocket launches on its website with a cost of 62 million dollars; other providers cost upwards of 165 million dollars each, much of the savings is because SpaceX can reuse the first stage. Therefore, if we can determine if the first stage will land, we can determine the cost of a launch.

### Problems you want to find answers

- Which variables affect the success of the first stage landing?
- Does the rate of successful landings increase over the years?
- What is the best algorithm that can be used for binary classification in this case?

# Methodology

#### **Executive Summary**

- Data collection methodology:
  - Using SpaceX Rest API
  - Using Web Scrapping from Wikipedia
- · Perform data wrangling
  - Filtering the data
  - Dealing with missing values
  - Using One Hot Encoding to prepare the data to a binary classification
- Perform exploratory data analysis (EDA) using visualization and SQL
- Perform interactive visual analytics using Folium and Plotly Dash
- Perform predictive analysis using classification models

### **Data Collection**

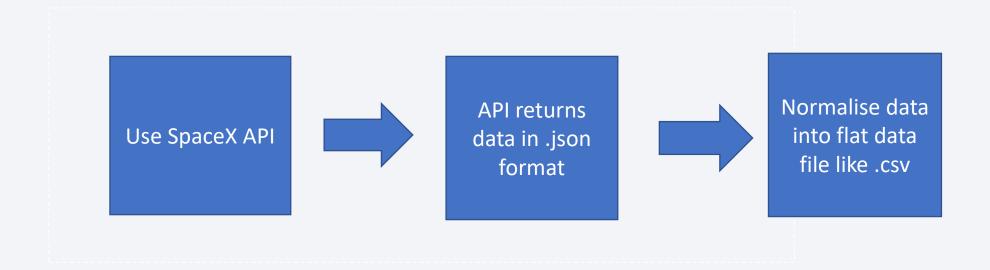

Data collection process involved a combination of API requests from SpaceX REST API and Web Scraping data from a table in SpaceX's Wikipedia entry.

We used both of these data collection methods in order to get complete information about the launches for a more detailed analysis.

**Using SpaceX REST API we obtained the following data**: FlightNumber, Date, BoosterVersion, PayloadMass, Orbit, LaunchSite, Outcome, Flights, GridFins, Reused, Legs, LandingPad, Block, ReusedCount, Serial, Longitude, Latitude

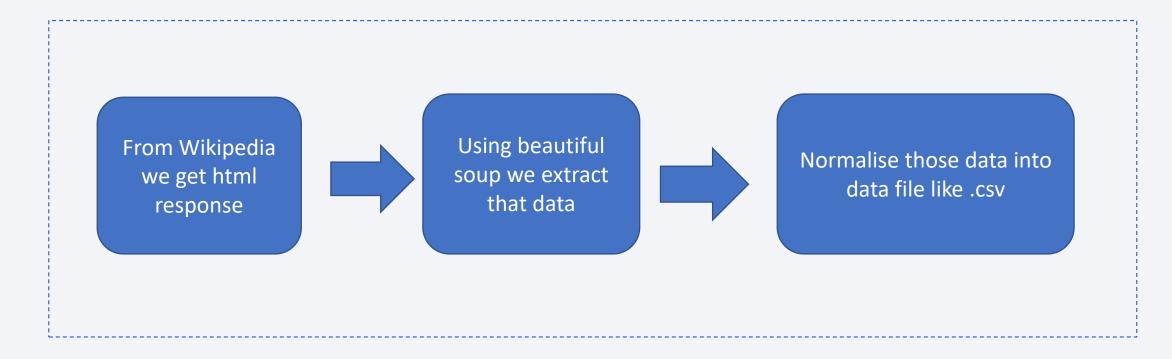

**Using Wikipedia Web Scraping we obtained the following data**: Flight No., Launch site, Payload, PayloadMass, Orbit, Customer, Launch outcome, Version Booster, Booster landing, Date, Time

# Data Collection – SpaceX API

# **Data Collection - Scraping**

• Source Code: https://github.com/labrost/IBM-Capstone-Project-SpaceX/blob/main/Data%20Collection%20with%20Webscraping.ipynb

# **Data Wrangling**

We performed exploratory Data Analysis and determined the Training Labels ("1" means the booster successfully landed, "0" means it was unsuccessful). We calculated the number of launches on each site and the the number and occurrence of each orbit. Then we calculated the number and occurrence of mission outcome per orbit type and finally we created a landing outcome label from the Outcome column. In the end we exported the data to .csv file.

### **EDA** with Data Visualization

- Scatter plots were used to show the relationship between variables. If a relationship exists, they could be used in a machine learning model.
- Bar charts were used to show comparisons among discrete categories. The goal is to show the relationship between the specific categories being compared and a measured value.
- Line charts were used to show trends in data over time (time series).

### **EDA** with SQL

#### These SQL queries were perfored:

- Displaying the names of the unique launch sites in the space mission
- Displaying 5 records where launch sites begin with the string 'CCA'
- Displaying the total payload mass carried by boosters launched by NASA (CRS)
- Displaying average payload mass carried by booster version F9 v1.1
- Listing the date when the first successful landing outcome in ground pad was achieved
- Listing the names of the boosters which have success in drone ship and have payload mass greater than 4000 but less than 6000
- Listing the total number of successful and failure mission outcomes
- Listing the names of the booster versions which have carried the maximum payload mass
- Listing the failed landing outcomes in drone ship, their booster versions and launch site names for the months in year 2015
- Ranking the count of landing outcomes (such as Failure (drone ship) or Success (ground pad)) between the date 2010-06-04 and 2017-03-20 in descending order
- Source Code: IBM-Capstone-Project-SpaceX/EDA with SQL.ipynb at main · labrost/IBM-Capstone-Project-SpaceX · GitHub

# Build an Interactive Map with Folium

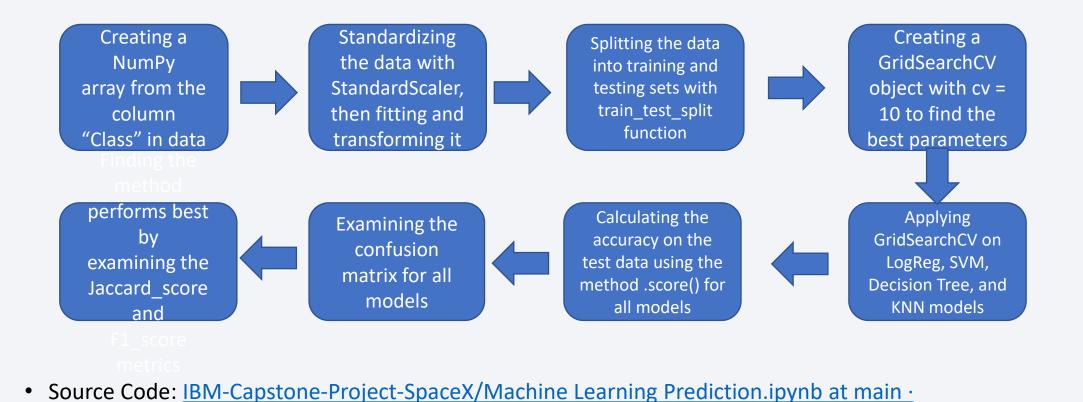

- Created Markers of all Launch Sites:
- Added Marker with Circle, Popup Label and Text Label of NASA Johnson Space Center using its latitude and longitude coordinates as a start location.
- Added Markers with Circle, Popup Label and Text Label of all Launch Sites using their latitude and longitude coordinates to show their geographical locations and proximity to Equator and coasts.
- Created coloured Markers of the launch outcomes for each Launch Site:
- Added coloured Markers of success (Green) and failed (Red) launches using Marker Cluster to identify which launch sites have relatively high success rates.
- Created Distances between a Launch Site to its proximities:
- Added coloured Lines to show distances between the Launch Site KSC LC-39A (as an example) and its proximities like Railway, Highway, Coastline and Closest City
- Source Code: https://github.com/labrost/IBM-Capstone-Project-SpaceX/blob/main/Interactive%20Analytics%20with%20Folium.ipynb

# Build a Dashboard with Plotly Dash

- Added a dropdown list to enable Launch Site selection.
- Added a pie chart to show the total successful launches count for all sites and the Success vs. Failed counts for the site, if a specific Launch Site was selected.
- Added a slider to select Payload range.
- Added a scatter chart to show the correlation between Payload and Launch Success
- Source Code: https://github.com/labrost/IBM-Capstone-Project-SpaceX/blob/main/spacex dash app.py

# Predictive Analysis (Classification)

labrost/IBM-Capstone-Project-SpaceX (github.com)

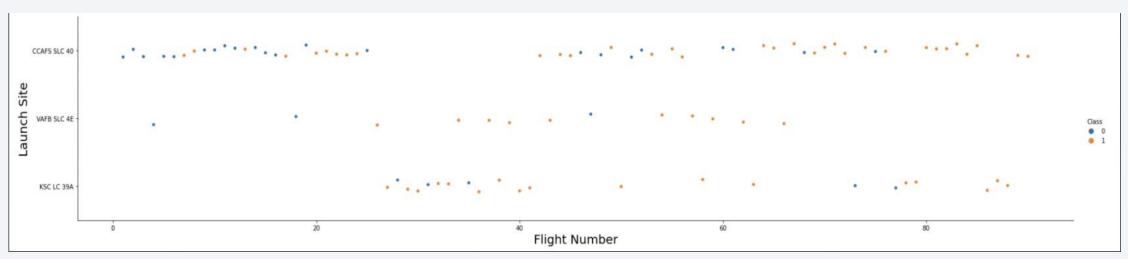

15

### Results

- Exploratory data analysis results
- Interactive analytics demo in screenshots
- Predictive analysis results

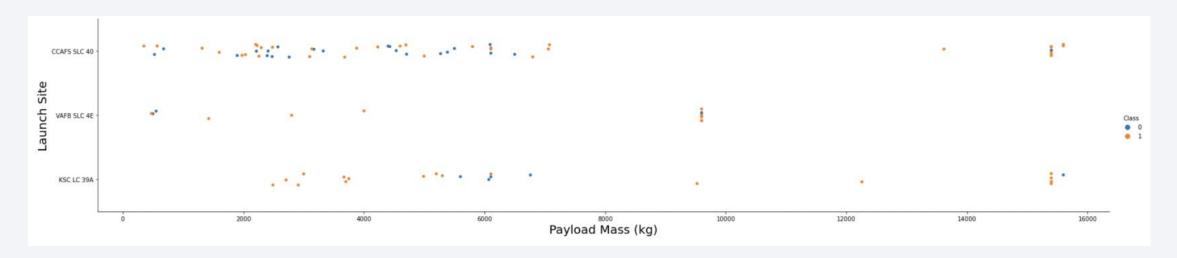

# Flight Number vs. Launch Site

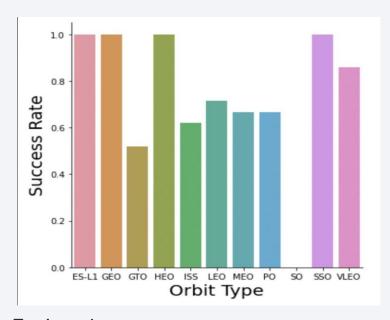

- The earliest flights all failed while the latest flights all succeeded.
- The CCAFS SLC 40 launch site has about a half of all launches.
- VAFB SLC 4E and KSC LC 39A have higher success rates.
- It can be assumed that each new launch has a higher rate of succes

### Payload vs. Launch Site

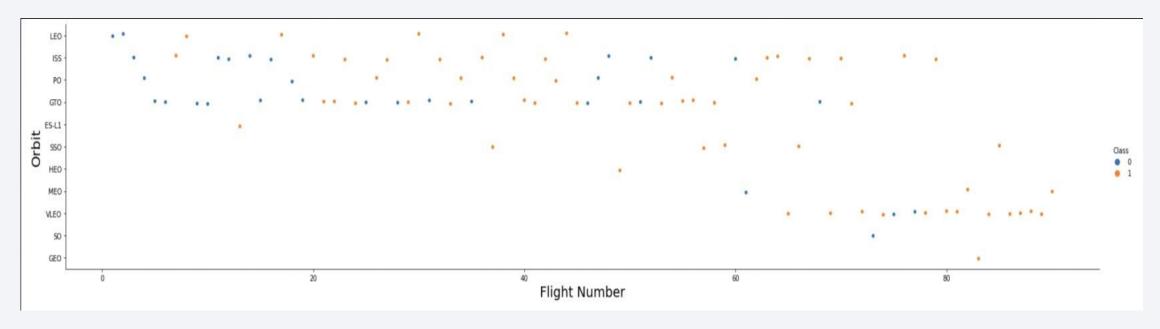

- For every launch site the higher the payload mass, the higher the success rate.
- Most of the launches with payload mass over 7000 kg were successful.
- KSC LC 39A has a 100% success rate for payload mass under 5500 kg too.

# Success Rate vs. Orbit Type

- Orbits with 100% success rate: ES-L1, GEO, HEO, SSO
- Orbits with 0% success rate: SO
- Orbits with success rate between 50% and 85%: GTO, ISS, LEO, MEO, PO

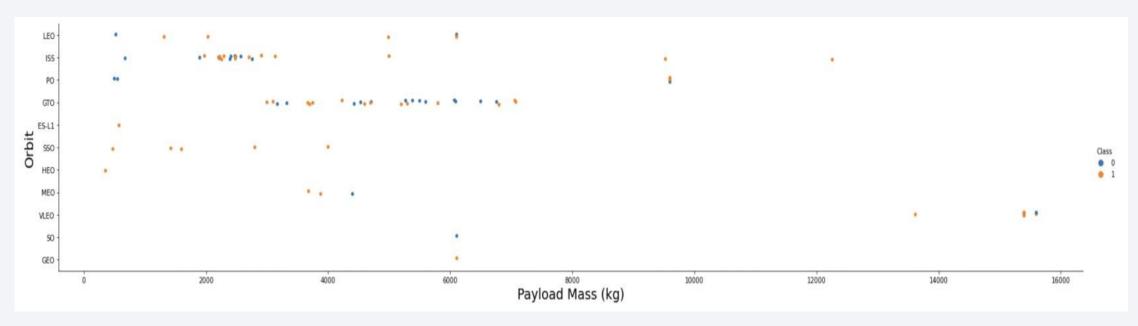

# Flight Number vs. Orbit Type

### **Explanation:**

• In the LEO orbit the Success appears related to the number of flights; on the other hand, there seems to be no relationship between flight number when in GTO orbit.

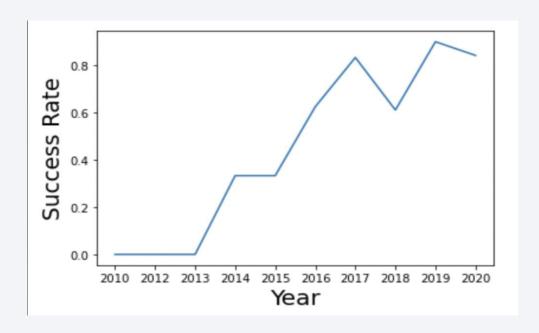

# Payload vs. Orbit Type

### **Explanation:**

• Heavy payloads have a negative influence on GTO orbits and positive on GTO and Polar LEO (ISS) orbits.

# Launch Success Yearly Trend

### **Explanation:**

• The success rate since 2013 kept increasing till 2020.

### All Launch Site Names

```
In [4]: %sql select distinct launch_site from SPACEXDATASET;

* ibm_db_sa://wzf08322:***@0c77d6f2-5da9-48a9-81f8-86b520b87518.bs2io90108kqblod8lcg.databases.appdomain.cloud:31198/bludb
Done.

Out[4]: launch_site

CCAFS LC-40

CCAFS SLC-40

KSC LC-39A

VAFB SLC-4E
```

### **Explanation:**

• Displaying the names of the unique launch sites in the space mission.

# Launch Site Names Begin with 'CCA'

```
In [5]: %sql select * from SPACEXDATASET where launch site like 'CCA%' limit 5;
          * ibm db sa://wzf08322:***@0c77d6f2-5da9-48a9-81f8-86b520b87518.bs2io90108kqb1od8lcg.databases.appdomain.cloud:31198/bludb
         Done.
Out[5]:
         DATE
                 time utc
                            booster_version launch_site payload
                                                                                   payload mass kg
                                                                                                     orbit customer
                                                                                                                     mission outcome landing outcome

                                                                                                      LEO
                                                                                                          NASA
                 15:10:00
                            F9 v1.0 B0007
                                                       SpaceX CRS-2
                                                                                  677
                                                                                                                      Success
                                                                                                                                       No attempt
         03-01
                                                                                                      (ISS) (CRS)
```

#### **Explanation:**

• Displaying 5 records where launch sites begin with the string 'CCA.

# **Total Payload Mass**

#### **Explanation:**

• Displaying the total payload mass carried by boosters launched by NASA (CRS).

# Average Payload Mass by F9 v1.1

#### **Explanation:**

Displaying average payload mass carried by booster version F9 v1.1

# First Successful Ground Landing Date

#### **Explanation:**

• Listing the date when the first successful landing outcome in ground pad was achieved.

### Successful Drone Ship Landing with Payload between 4000 and 6000

```
In [9]: %sql select booster_version from SPACEXDATASET where landing_outcome = 'Success (drone ship)' and payload_mass_kg_ between 4 000 and 6000;

* ibm_db_sa://wzf08322:***@0c77d6f2-5da9-48a9-81f8-86b520b87518.bs2io90108kqblod8lcg.databases.appdomain.cloud:31198/bludb Done.

Out[9]: booster_version
F9 FT B1022
F9 FT B1026
F9 FT B1021.2
F9 FT B1031.2
```

#### **Explanation:**

• Listing the names of the boosters which have success in drone ship and have payload mass greater than 4000 but less than 6000.

### Total Number of Successful and Failure Mission Outcomes

```
In [10]: %sql select mission_outcome, count(*) as total_number from SPACEXDATASET group by mission_outcome;

* ibm_db_sa://wzf08322:***@0c77d6f2-5da9-48a9-81f8-86b520b87518.bs2io90108kqblod8lcg.databases.appdomain.cloud:31198/bludb Done.

Out[10]: mission_outcome total_number
Failure (in flight) 1
Success 99
Success (payload status unclear) 1
```

#### **Explanation:**

• Listing the total number of successful and failure mission outcomes.

# **Boosters Carried Maximum Payload**

```
In [11]: %sql select booster_version from SPACEXDATASET where payload_mass__kg_ = (select max(payload_mass__kg_) from SPACEXDATASET);
           * ibm db sa://wzf08322:***@0c77d6f2-5da9-48a9-81f8-86b520b87518.bs2io90108kgblod8lcg.databases.appdomain.cloud:31198/bludb
Out[11]:
          booster_version
          F9 B5 B1048.4
          F9 B5 B1049.4
          F9 B5 B1051.3

          F9 B5 B1058.3
          F9 B5 B1051.6
          F9 B5 B1060.3
          F9 B5 B1049.7
```

#### **Explanation:**

• Listing the names of the booster versions which have carried the maximum payload mass.

### 2015 Launch Records

#### **Explanation:**

• Listing the failed landing outcomes in drone ship, their booster versions and launch site names for the months in year 2015.

### Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

```
In [13]: %%sql select landing outcome, count(*) as count outcomes from SPACEXDATASET
                where date between '2010-06-04' and '2017-03-20'
                group by landing outcome
                order by count outcomes desc;
           * ibm db sa://wzf08322:***@0c77d6f2-5da9-48a9-81f8-86b520b87518.bs2io90108kgblod8lcg.databases.appdomain.cloud:31198/bludb
         Done.
Out[13]:
          landing_outcome
                              count outcomes
          No attempt
                              10
          Failure (drone ship)
          Success (drone ship)
          Controlled (ocean)
          Success (ground pad) 3
          Failure (parachute)
          Uncontrolled (ocean)
          Precluded (drone ship) 1
```

#### **Explanation:**

• Ranking the count of landing outcomes (such as Failure (drone ship) or Success (ground pad)) between the date 2010-06-04 and 2017-03-20 in descending order.

# Launch sites on a global map

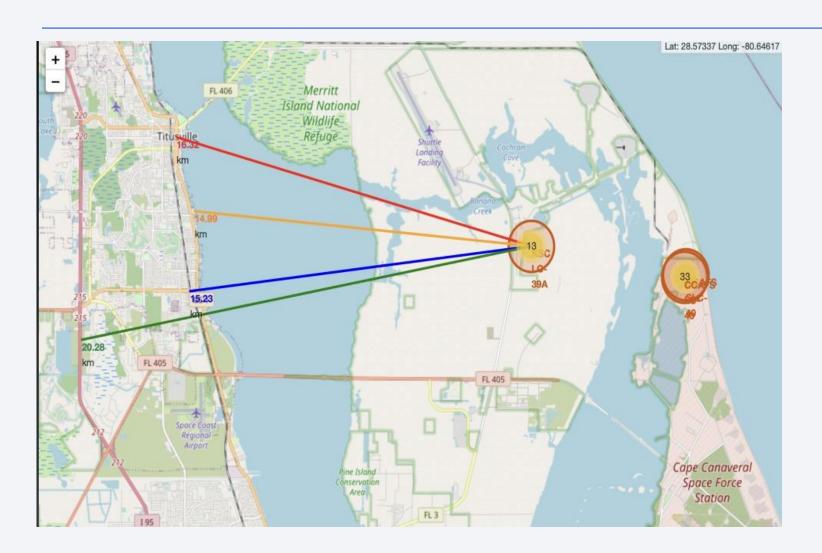

All launch sites are in very
close proximity
to the coast, since launching
rockets
near the ocean minimises
the risk of
explodions
near people.

### Colour-labeled launch outcomes

- From the colour-labeled markers we are able to easily identify which launch sites have relatively high success rates. Green Marker = Successful Launch Red Marker = Failed Launch
- Launch Site KSC LC-39A has a very high Success Rate.

### Distance from the launch site KSC LC-39A to its proximities

- From the visual analysis of the launch site KSC LC-39A we can clearly see that it is:
- relative close to railway (15.23 km)
- relative close to highway (20.28 km)
- relative close to coastline (14.99 km)
- Also the launch site KSC LC-39A is relative close to its closest city Titusville (16.32 km).
- Failed rocket with its high speed can cover distances like 15-20 km in few seconds. It could be potentially dangerous to populated areas.

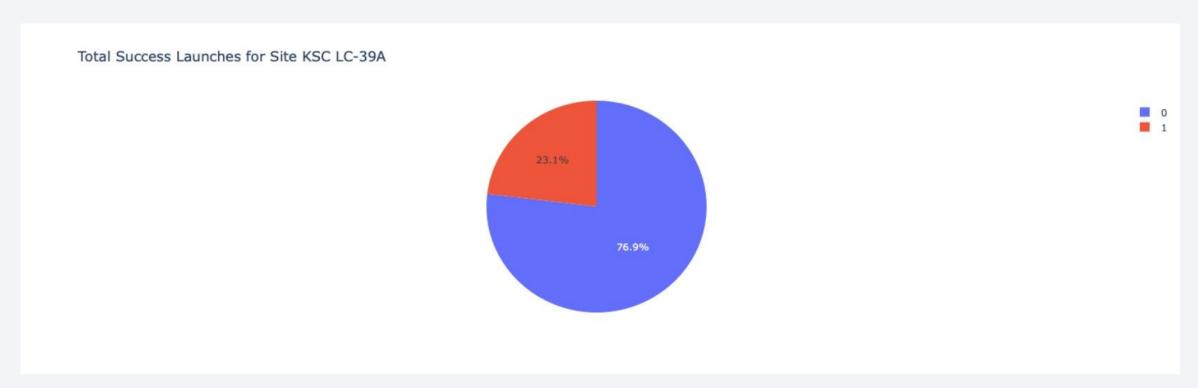

# Successful launches by each launch site

#### **Explanation:**

• The chart clearly shows that from all the sites, KSC LC-39A has the most successful launches.

# Launch site with the highest launch success ratio

### **Explanation:**

• KSC LC-39A has the highest launch success rate (76.9%) with 10 successful and only 3 failed landings.

### Payload Mass vs. Launch Outcome for all sites

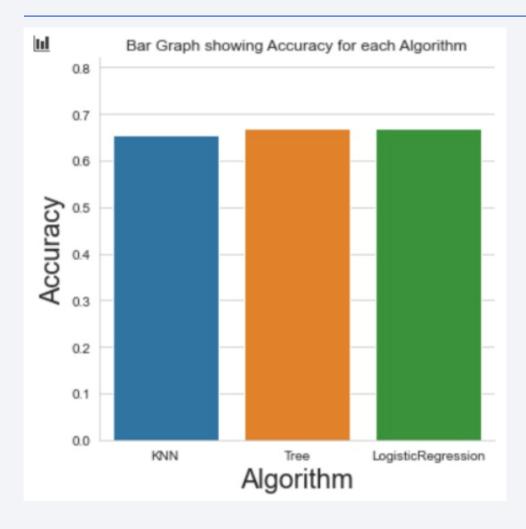

#### Explanation:

• The charts show that payloads between 2000 and 5500 kg have the highest success rate.

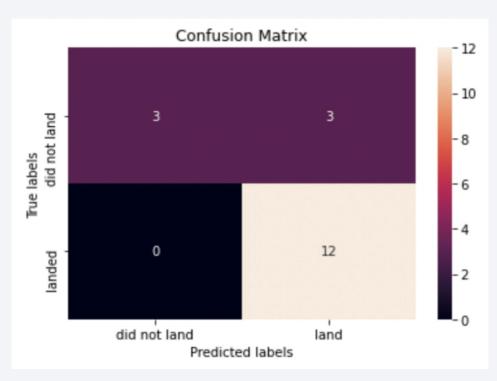

# Classification Accuracy

• The decision tree classifier is the model with the highest classification accuracy.

### **Confusion Matrix**

• Examining the confusion matrix, we see that the decision tree classifier can distinguish between the different classes. We see that the major problem is false positives, ie unsuccessful landing marked as successful by the classifier.

### **Conclusions**

#### We conclude that:

- Decision Tree Model is the best algorithm for this dataset.
- Launches with a low payload mass show better results than launches with a larger payload mass.
- Most of launch sites are in proximity to the Equator line and all the sites are in very close proximity to the coast.
- The success rate of launches increases over the years.
- KSC LC-39A has the highest success rate of the launches' from all the sites.
- Orbits ES-L1, GEO, HEO and SSO have 100% success rate
